

Exam Code: P_C4H34_2411

**Exam Name | SAP Certified Professional - Developer - SAP
Commerce Cloud**

Total No. of Questions: 80

Passing Percentage: 61%

Exam Duration: 180 Minutes.

Question 1

The Scripting Engine allows you to run logic written in one of three scripting languages at run time without restarting the SAP Commerce Cloud Server. How can scripts be applied out of the box in SAP Commerce Cloud? Note: There are 3 correct answers to this question.

- A. By implementing a Cronjob with dynamic script-based logic
- B. By implementing an Action in a process definition file by referencing an external script
- C. By creating a new Event to be communicated between services in the service layer
- D. By providing a TaskRunner implementation based on scripts to run dynamic tasks.
- E. By including scripts in ImpEx to execute additional code during the data import process.

Answer A B E

Question 2

What should you pay attention to when you are working with a web hook? Note: There are 2 correct answers to this question.

- A. A webhook guarantees the At Least Once (ALO) delivery principle, and concurrent events are not completely discarded.
- B. A webhook requires an integration object as the notification payload, and the consumed destination as the webhook subscriber.
- C. A webhook uses the optional filter attribute to control which consumed destination will receive notifications.
- D. A webhook can be configured to send notifications when an item is created, updated, or deleted.

Answer B D

Question 3

The build process in SAP Commerce Cloud looks for project customizations (eg for custom extensions or composable storefront) in a project repository.

What are the recommended principles for setting up the project repository? Note: There are 2 correct answers to this question.

- A. A manifest.json file is located in the root directory to specify build properties for all customizations.
- B. A manifest.json file is placed under a separate subdirectory for each customization C. A core-customize folder is created in the root directory for SAP Commerce Cloud customizations.
- C. A single root directory is created with JavaScript storefront support

Answer B C

Question 4

The miniature car replicas that your company sells on its site are now available in a choice of colors, each at a different price point. You want your product page to let your customers select the color before adding the replica to the cart. To complicate things, your boss won't let you restart your production servers to add this functionality.

What entities would you have to create to achieve this?

- A. A Composed Type, that extends the Variant Product type to add a color attribute, and an instance of this type for each color that a given replica is available in
- B. A ConfigurationCategory, an AbstractConfigurator Setting for color, a Configurator Type, and an OrderEntryProductinfo for each color that a given replica is available in.
- C. A ClassificationCategory, a ClassificationAttribute for color, a ClassificationAttributeUnit, a ClassificationAttributeValue for each color that a given replica is available in, plus a Class AttributeAssignmentModel instance to tie them together
- D. A VariantCategory for color, a VariantValueCategory for each color option, and a Generic Variant Product for each color that a given replica is available in.

Answer C

Question 5

When you are defining properties in manifest json, which of the following attributes are you allowed to use? Note: There are 3 correct answers to this question.

- A. persona
- B. value
- C. key
- D. environment
- E. name

Answer A B C
